

# Public Revenue Office – eTax

**Client:** Public Revenue Office

**Country:** Republic of Macedonia

**Industry:** Public sector

**Business challenge:** The Public revenue Office faced a overcrowding in their offices, especially in period of tax registration. Therefore, the objectives of the eTax project were creating and maintaining on-line services that will enable filing of all individual and company taxes through a Web portal using security methods of e-identification.

**Solution:** eTax

**Seavus** developed online solution for tax registration.

The e-Tax services are restricted to taxes to be paid by major companies corresponding to the 100 biggest companies in the Republic of Macedonia. The system is however flexible enough to support additional taxpayers without any after-delivery enhancements.

The system integrates with several banking systems from different sectors of the Macedonian government. The integration is mainly done using SOAP and also RPC in some cases.

## **Benefits:**

The electronic system for submission of tax forms enables each company with access to the internet network to be able to handle their taxes without waiting in lines and handling them personally. The system provides to the companies a way how to alleviate the stress and effort when they submit their taxes.

**Technologies utilized:** The system was developed using Java Server Pages (JSP), WebSphere on AIX operating system and Informix Database.
